

Requirements Angular, Typescript

For managing customers, (ID, first name, last name, birth date, active) and Angular web app should be created. It should provide the following features:

- list all customers and filter the list,*
- add new customers*
- edit existing customers*
- delete existing customers*

The backend does not need to be developed, but the web app should be testable in a sensible way.

We will have to demonstrate some code and comment on it orally according to questions from the professor in sort of an exam situation.

The demo code we went through in the class is here:
